

The background of the slide features a stylized globe with the ANSYS logo in the center. The globe is surrounded by a complex, glowing field of blue and orange lines, resembling a magnetic field or a complex simulation visualization. The lines are dense and swirling, creating a sense of dynamic energy.

# Integration of APECS and Aspen Dynamics

**NETL 2009 Workshop on  
Advanced Process  
Engineering Co-Simulation  
October 20-21, 2009**

# Objective

- Develop a prototype APECS controller for transient co-simulation
- Demonstrate coupling between FLUENT and Aspen Dynamics

- **Aspen Dynamics does not have a CAPE-OPEN block like Aspen Plus**
- **To date, transient simulations have not been considered within the framework of CAPE-OPEN**
- **Unsteady CFD simulations are considerably more time-consuming than steady simulations**
- **Using unsteady CFD simulations within a co-simulation environment poses additional technical difficulties (e.g., “remembering” the initial state)**
  - Assume quasi-steady
  - $\tau_{\text{CFD}} \ll \tau_{\text{Plant}}$

# Available Capabilities

- **Aspen Custom Modeler (ACM) permits user-defined blocks to be created and exported**
  - Permits customization at the “block” level
  - Custom blocks can be used in Aspen Dynamics
  - Custom blocks can call external functions
- **Simulation Access eXtension (SAX) capability**
  - Operates at the “flowsheet” level
  - Can call functions at beginning/end of timestep
- **ACM “Events”**
  - Event triggers: OnDeletedBlock, OnNewBlock, etc.
- **ACM Custom Forms**
  - Customized GUI

# Capabilities Used for Prototype

- **Aspen Custom Modeler (ACM) permits user-defined blocks to be created and exported**
  - Permits customization at the “block” level
  - Custom blocks can be used in Aspen Plus Dynamics
  - Custom blocks can call external functions
- **Simulation Access eXtension (SAX) capability**
  - Operates at the “flowsheet” level
  - Can call functions at beginning/end of timestep
- **ACM “Events”**
  - Event triggers: OnDeletedBlock, OnNewBlock, etc.
- **ACM Custom Forms**
  - Customized GUI

# Aspen Dynamics Wrapper

# Architecture for Dynamic Co-Simulation

# Aspen Dynamics Wrapper Functions

## INITIAL APPROACH

## FINAL APPROACH

### PRECALL

Create COUnitManager  
Start FLUENT  
Load Case/Data files

### OUTPUTS

Create COUnitManager  
Start FLUENT  
Load Case/Data files  
Set boundary conditions  
Converge FLUENT model  
Return outputs  
Exit FLUENT  
Clean up

Set boundary conditions  
Converge FLUENT model  
Return outputs

### POSTCALL

Exit FLUENT  
Clean up

**PRECALL ➡ OUTPUTS ➡ OUTPUTS ➡ ... ➡ OUTPUTS ➡ POSTCALL**

# Test 1 – Verify Correct Outputs

- 2D FLUENT “Dual Pipe” model
  - 2 inlets / 2 outlets, no mixing

S1.AllVariables Table

	Value	Spec	Units

# Test 2 – Benchmark Run Times

- **Case 1**
  - Pipe Model ROM Template
  - Fastest APECS block
  - Steady and Dynamic Co-Simulation
- **Case 2**
  - 2D FLUENT “Triple Pipe” model
  - 1200 quad cells
  - 3 inlets / 3 outlets, no mixing
  - Steady and Dynamic Co-Simulation

# Case 1 – Data Transferred

## \*\*\*\*\* INPUTS \*\*\*\*\*

Block Name: PIPE\_MODEL

Number of Inlet Ports: 10

Number of Outlet Ports: 10

Number of CONNECTED Inlet Ports: 1

Number of CONNECTED Outlet Ports: 1

Number of Species: 3

Specie 0 is ETOH

Specie 1 is H2O

Specie 2 is MEOH

Inlet Port Name = inlet\_port

Inlet Flow Rate = 0.02 kg/s

Inlet Temperature = 313.15 K

Inlet Pressure = 100000.00 Pa

Inlet Mass Fraction [0] = 0.2876

Inlet Mass Fraction [1] = 0.1124

Inlet Mass Fraction [2] = 0.6000

Outlet Port Name = outlet\_port

Persistence String 0 is InstanceKey\_47

Persistence String 1 is UnusedPersistenceString\_1

Persistence String 2 is UnusedPersistenceString\_2

## \*\*\*\*\* OUTPUTS \*\*\*\*\*

OUTPUTS was called 60 times

Retrieving the CUnitManager pointer. Block Name: PIPE\_MODEL

Setting values of persistence strings in OUTPUTS now.

Persistence String 0 is now InstanceKey\_47

Persistence String 1 is now UnusedPersistenceString\_1

Persistence String 2 is now UnusedPersistenceString\_2

Outlet flow rate for outlet\_port is 0.02 kg/s

Outlet temperature for outlet\_port is 313.15 K

Outlet Pressure for outlet\_port is 99000.00 Pa

Outlet Mass Fractions for outlet\_port are:

Species [0]: 0.28755 (ETOH)

Species [1]: 0.11246 (H2O)

Species [2]: 0.59999 (MEOH)

\*\*\*\*\*

# Case 2 – Dynamic Co-Simulation

S1.AllVariables Table		
	Value	Spec
<ComponentList	Default	
<Connected	TRUE	
<F	10.0	Fixed
<h	500.0	Fixed
<P	1.0	Fixed
<PortName	inlet_1	
<T	80.0	Fixed
<V	0.05	Fixed
<z("ETOH")	0.2	Fixed
<z("H2O")	0.2	Fixed
<z("MEOH")	0.6	Fixed

Variable Ramp

Start time: 0 Seconds

Final value: 10 kmol/hr

Duration: 5 Seconds

OK Cancel

# Benchmark Results

Model	Mode	Inputs	Simulation Time, s	Real Time, s	“Output” Calls
Pipe Model ROM Template	Steady			407*	60
Pipe Model ROM Template	Unsteady	Steady	5	7200	1080
2D FLUENT Model	Steady			1096	60
2D FLUENT Model	Unsteady	Ramped (5 seconds)	10	22098	1380

\*for comparison, this model takes ~1 second in Aspen Plus

# Summary

- **The feasibility of dynamic co-simulation was investigated**
- **A prototype Aspen Dynamics Wrapper was created to demonstrate dynamic co-simulation**
- **Run times were significantly longer for dynamic co-simulation than for steady co-simulation**
- **Promising future research: use ROMs capable of computing derivatives (e.g., Regression ROM) and return Jacobian to Aspen Dynamics**
  - Expected to significantly reduce the number of “Output” calls required
